

25

threshold level, and then at that point using said API to submit a command file for execution by a sub-agent to create a resulting file identified by said unique filename;

after the API has submitted said command file for execution by a sub-agent, said control program agent enters a state of awaiting execution of said command file by said sub-agent;

and wherein after execution by said sub-agent, thereafter the control program agent reads the resulting file identified by said unique filename and dynamically creates new HTML statements to report results according to a request of the web browser with said unique filename identified.

26

33. A method of fulfilling requests according to claim 32 wherein the steps further comprise: retrieving with said new HTML statement information user requested data contained in said resulting file identified by said unique filename so that said user requested data can be provided with the results as a completed command file report.

34. A method of fulfilling requests according to claim 33 wherein the steps further comprise: testing with said control program agent for the kind of report to be created by obtaining information from stored variables and identifies output parameters, and branching to the sequence applicable to the type of report to be created in the process of completing said command file report.
